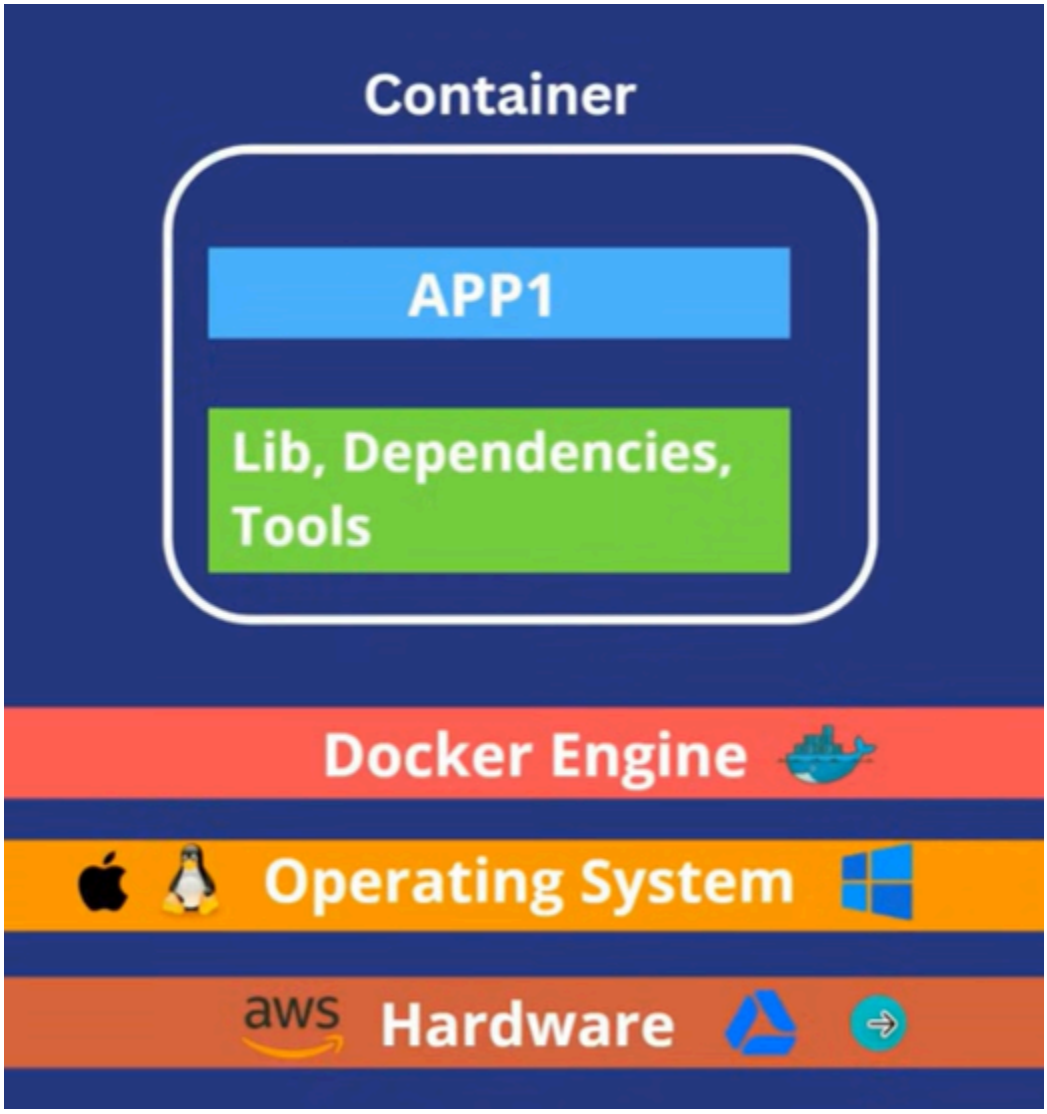
Architecture of Docker

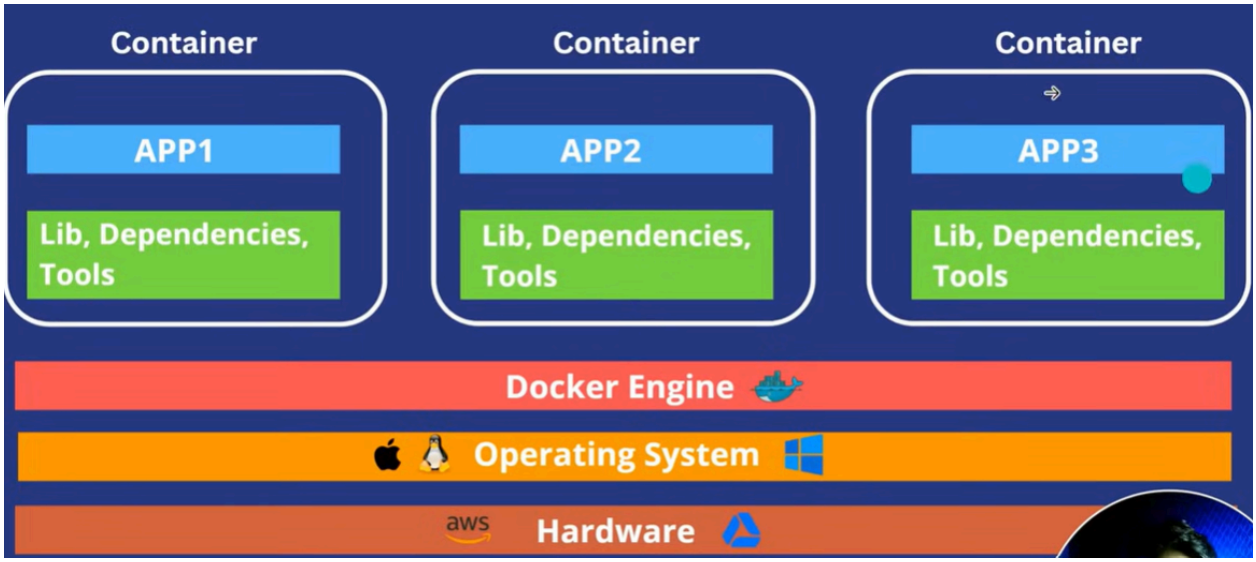


Examples of:

1. Hardware: server, Computer, Desktop, Laptop, AWS(Cloud Based Infrastructure), etc
2. Operating System: Apple, Linux and windows.
3. Docker Engine: Managing the containers.

Container is like a isolated environment, where application(Example: App1) run within the environment, what every necessary things required to run the App1 is present inside the container.

If you wanted, running multiple containers is possible,



And from the above image, there's no connection between containers.
