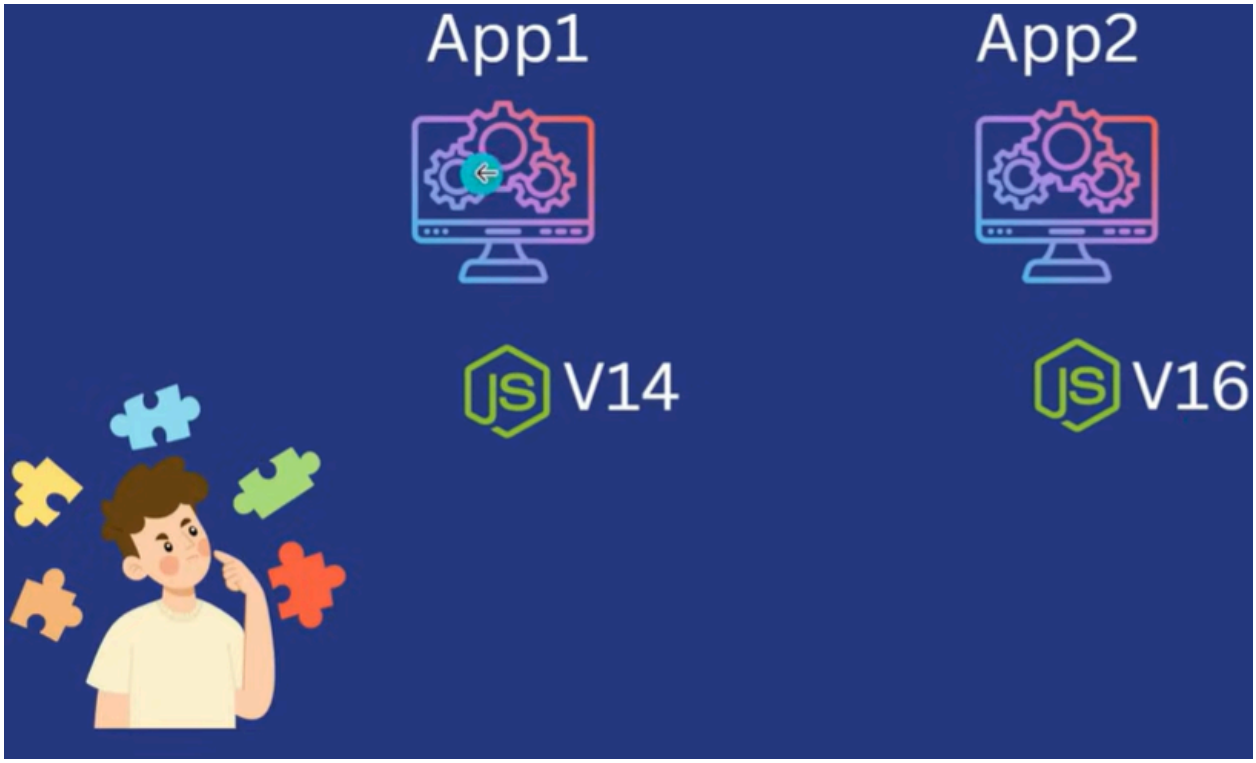
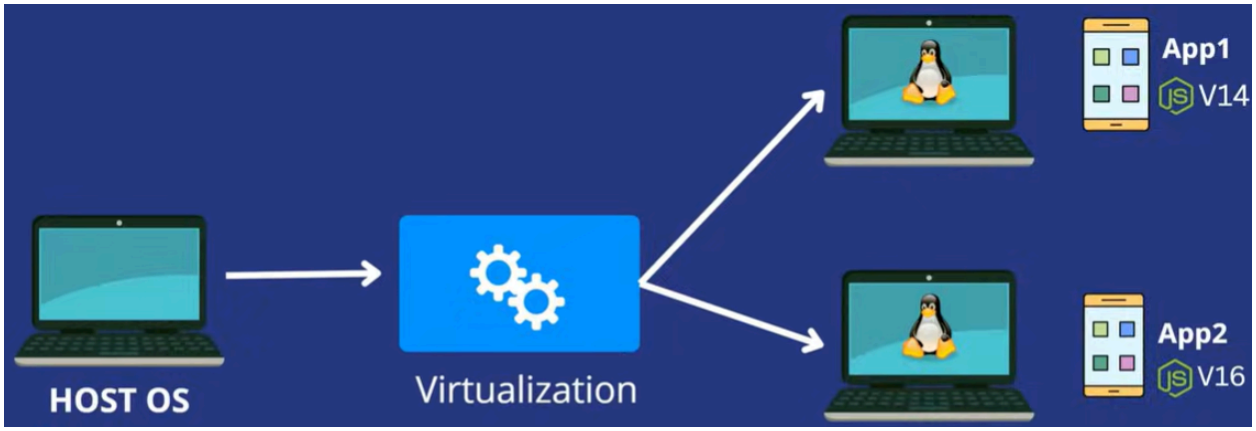
# Running Multiple Version of same Application Docker

Suppose in a same laptop, working on different application in same time. Eg: app1 uses node version 14, for app2 uses version 16.



Using one server, and how to test and use different version of node on the same server. This is also solvable by Docker using containerization concept.



Virtualization: By Creating two virtual machines for each app and different node versions. Other advantage of Docker, you can use multiple versions of docker.
