```

when using " sudo dnf -y install dnf-plugins-core" says dnf command not found

That error simply means your system **doesn't have `dnf` installed** (or it's not in PATH). This usually happens when:

- You're **not on a DNF-based distro** (like Fedora/RHEL 8+/CentOS Stream)
- Or your system uses another package manager

🔍 Step 1: Identify Your Linux Distribution

Run:

cat /etc/os-release

Look at the `ID=` field. Based on that:

🧭 What to Do Based on Your OS

🟢 If you're on Ubuntu / Debian

`dnf` won't exist. Use `apt` instead:

sudo apt update
sudo apt install software-properties-common

🔵 If you're on Arch Linux

Use `pacman`:

```
sudo pacman -Syu
sudo pacman -S base-devel
```

🔴 If you're on older CentOS / RHEL (7 or below)

They use `yum`, not `dnf`:

```
sudo yum install yum-utils
```

🟡 If you're supposed to be on Fedora / RHEL 8+ but `dnf` is missing

That’s unusual. Try:

```
which dnf
```

If nothing shows, your system might be:

- Minimal install without package tools
- Corrupted environment
- Or you're inside a restricted container

⚡ Quick Fix (If You Expected DNF)

Try installing it manually:

```
sudo yum install dnf   # if yum exists
```

🧠 Key Insight (Important for DevOps/SDET mindset)

Different Linux families use different package managers:

Distro Family	Package Manager

Debian/Ubuntu	`apt`
Fedora/RHEL	`dnf`
CentOS 7	`yum`
Arch	`pacman`

✅ What I Need From You

Paste the output of:

cat /etc/os-release

Then I'll give you the **exact command tailored to your system** (no guessing).

after "sudo apt install software-properties-common" says not upgrading:9

That message is actually **not an error** 👍 — it's normal behavior from `apt`.

✅ What "not upgrading: 9" Means

When you ran:

sudo apt install software-properties-common

And saw something like:

0 upgraded, 0 newly installed, 0 to remove and 9 not upgraded.

It means:

- ✅ The package is **already installed**
- ⚠️ There are **9 packages on your system that have updates available**, but they were **not upgraded yet**

🔧 How to Fix It (Recommended)

Run a full upgrade:

sudo apt update
sudo apt upgrade -y

If you want to upgrade **everything including dependencies and kernel**:

sudo apt full-upgrade -y

🧠 Why This Happens (Important Insight)

- `apt install <package>` only installs that specific package
- It **does NOT upgrade the whole system**
- So pending updates stay → shown as “not upgraded”

🚀 What You Should Do Next

After upgrading, continue your original goal.

But note:

👉 You’re on **Ubuntu/Debian**, so:

- ❌ `dnf` is NOT needed
- ✅ Use `apt` for everything

⚠️ Important Correction

If you were following a guide using:

sudo dnf install dnf-plugins-core

That guide is for:

- Fedora / RHEL systems

👉 On Ubuntu, the equivalent tools are different. Tell me what you were trying to achieve (Docker, Kubernetes, repo setup, etc.), and I’ll give you the **correct Ubuntu commands**.

during " sudo dnf -y install dnf-plugins-core" dnf command not found, then what must be done

If you're seeing `dnf: command not found`, it simply means your system **does not use DNF** (or it's not installed). This usually happens when you're on **Ubuntu/Debian**, because:

- **DNF → Fedora / RHEL / CentOS**
- **APT → Ubuntu / Debian**

✅ Step 1: Check your OS

Run:

cat /etc/os-release

👉 If you see **Ubuntu / Debian**, then **DNF is not supposed to be there**.

✅ Step 2: Use the correct command (APT alternative)

Instead of:

sudo dnf -y install dnf-plugins-core

Use:

sudo apt update
sudo apt install software-properties-common

👉 You already ran this, and saw:

> "not upgrading: 9"

That's **NOT an error** — it just means some packages were held back.

✅ Step 3: If you specifically NEED DNF (rare case)

Only do this if you're following a guide that strictly requires DNF:

sudo apt install dnf

Then try again:

sudo dnf install dnf-plugins-core

🔥 Best Practice (Important)

Don’t mix package managers unless necessary.

OS	Package Manager
Ubuntu/Debian	`apt` ✅
Fedora	`dnf` ✅
CentOS/RHEL	`dnf` ✅

🚀 Quick Fix Summary

- On Ubuntu → **Use `apt`, ignore `dnf`**
- On Fedora → **DNF should already exist**
- If missing → install `dnf` manually

⚡ If you're following a tutorial

Tell me:
👉 *What are you trying to install/setup?*

I’ll convert the **exact commands to Ubuntu-compatible ones** so you don’t get stuck.

during "sudo dnf install dnf-plugins-core" says unable to defect version

That error **“unable to detect version”** usually happens because you're trying to use **DNF on a system that isn’t designed for it (like Ubuntu/Debian)** or DNF is **partially installed / misconfigured**.

Let’s fix this cleanly 👇

🚨 Root Cause (Most Likely)

- You are on **Ubuntu/Debian**
- You installed `dnf` manually
- But **DNF expects Fedora/RHEL repos**, which don't exist on Ubuntu
  👉 So it fails with *"unable to detect version"*

✅ Best Solution (Recommended)

👉 **Stop using DNF on Ubuntu**

Instead, use the native package manager:

```
sudo apt update
sudo apt install software-properties-common
```

👉 This is the **correct replacement** for:

```
sudo dnf install dnf-plugins-core
```

❗ If you were following a tutorial

Many tutorials are written for:

- Fedora
- CentOS
- RHEL

So commands like:

```
sudo dnf install dnf-plugins-core
```

👉 **won't work on Ubuntu**

🔄 Equivalent Mapping (Very Important)

DNF Command	Ubuntu Equivalent
`dnf install`	`apt install`
`dnf update`	`apt update && apt upgrade`
`dnf-plugins-core`	`software-properties-common`

🧹 Optional Cleanup (Recommended)

If you installed DNF unnecessarily, remove it:

```
sudo apt remove dnf -y
sudo apt autoremove -y
```

⚡ If you REALLY need DNF

Then you should use a **Fedora-based system** instead:

- Install **Fedora** OR
- Use Docker:

```
docker run -it fedora bash
```

🚀 Final Advice

👉 Don't force DNF on Ubuntu — it will keep breaking.

👍 Next Step

Tell me:
👉 *What are you trying to install or configure?*

I'll give you the **exact working Ubuntu commands** (no errors, no confusion).

I am trying to install docker in Ubuntu which is in virtual box

Got it — you're on **Ubuntu (VirtualBox)** and following a guide that uses **DNF (Fedora)**. That's why you're getting errors.

👉 Don't use `dnf` at all. Let's install Docker the **correct Ubuntu way** step-by-step.

🐳 Install Docker on Ubuntu (Works 100%)

Step 1: Remove any wrong/old Docker installs

```
sudo apt remove docker docker-engine docker.io containerd runc -y
```

Step 2: Update system

```
sudo apt update
sudo apt upgrade -y
```

Step 3: Install required dependencies

```
sudo apt install apt-transport-https ca-certificates curl software-properties-common -y
```

Step 4: Add Docker's official GPG key

```
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -
```

Step 5: Add Docker repository

```
sudo add-apt-repository \
  "deb [arch=amd64] https://download.docker.com/linux/ubuntu \
  $(lsb_release -cs) stable"
```

Step 6: Install Docker

```
sudo apt update
```

sudo apt install docker-ce -y

Step 7: Start & enable Docker

sudo systemctl start docker
sudo systemctl enable docker

Step 8: Verify installation ✅

docker --version

Step 9 (Optional but Important): Run Docker without sudo

sudo usermod -aG docker $USER

👉 Then **log out & log back in** (or restart VM)

Step 10: Test Docker

docker run hello-world

⚠️ VirtualBox Important Fix (If Docker fails)

Sometimes Docker fails inside VirtualBox due to virtualization settings.

👉 Make sure:

- **Enable VT-x/AMD-V** in BIOS
- In VirtualBox:
  - Settings → System → Processor → Enable **PAE/NX**
  - Settings → System → Acceleration → Enable **VT-x/AMD-V**

🚀 Summary

- ❌ Don't use `dnf` on Ubuntu
- ✅ Use `apt` (above steps)
- 🐳 Docker will work perfectly in VirtualBox

👍 If you want next level

I can help you:

- Install **Docker Compose**
- Set up a **DevOps project (CI/CD + Docker)**
- Or create a **resume-ready Docker project (SDET/DevOps)**

Just tell me 👍

```
routhkiranbabu@routhkiranbabu-VirtualBox:~$ sudo apt update
Get:1 https://download.docker.com/linux/ubuntu bionic InRelease [64.4 kB]
Err:1 https://download.docker.com/linux/ubuntu bionic InRelease
  The following signatures couldn't be verified because the public key is not available: NO_PUBKEY 7E
A0A9C3F273FCD8

Hit:4 http://in.archive.ubuntu.com/ubuntu questing InRelease
Hit:5 http://in.archive.ubuntu.com/ubuntu questing-updates InRelease
Hit:6 http://in.archive.ubuntu.com/ubuntu questing-backports InRelease
Warning: OpenPGP signature verification failed: https://download.docker.com/linux/ubuntu bionic InRel
ease: The following signatures couldn't be verified because the public key is not available: NO_PUBKE
Y 7EA0A9C3F273FCD8
Error: The repository 'https://download.docker.com/linux/ubuntu bionic InRelease' is not signed.
Notice: Updating from such a repository can't be done securely, and is therefore disabled by default.
Notice: See apt-secure(8) manpage for repository creation and user configuration details.
Notice: Some sources can be modernized. Run 'apt modernize-sources' to do so.
routhkiranbabu@routhkiranbabu-VirtualBox:~$
```

how to remove this error

You're very close 👍 — this error is actually **common when Docker repo is added incorrectly or GPG key is missing/outdated**.

❌ Problem Summary

- Your system is **Ubuntu "questing" (new version)**
- But Docker repo is pointing to **`bionic` (old Ubuntu 18.04)** ❌
- Also **GPG key is missing**, so apt blocks it

✅ Clean Fix (Do This Exactly)

🧹 Step 1: Remove wrong Docker repo

sudo rm /etc/apt/sources.list.d/docker.list

🔑 Step 2: Add correct Docker GPG key (modern method)

sudo mkdir -p /etc/apt/keyrings

curl -fsSL https://download.docker.com/linux/ubuntu/gpg | \
sudo gpg --dearmor -o /etc/apt/keyrings/docker.gpg

📦 Step 3: Add correct repository (IMPORTANT)

echo \
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg]
https://download.docker.com/linux/ubuntu \
$(lsb_release -cs) stable" | \
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null

👉 `$(lsb_release -cs)` automatically uses your correct version (like `questing`)

🔄 Step 4: Update again

sudo apt update

✅ Now the error should be gone

🐳 Step 5: Install Docker

sudo apt install docker-ce docker-ce-cli containerd.io -y

🚨 Why This Happed (Important for Interviews)

- Repo mismatch (**bionic vs questing**)
- Missing GPG key → **APT security blocks install**
- Old method (`apt-key`) is deprecated

👉 This is a **real-world DevOps troubleshooting scenario** — good learning 👍

🚀 Quick Check

After fixing:

docker --version

👍 If Still Error

Paste output of:

lsb_release -a
cat /etc/apt/sources.list.d/docker.list

I'll fix it instantly for you.

```
routhkiranbabu@routhkiranbabu-VirtualBox:~$ echo \
> "deb [arch=$(dpkg --print-architecture) signed-by=etc/apt/keyrings/docker.gpg] h
ker.com/linux/ubuntu \"
> $(lsb_release -cs) stable" | \
> sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
routhkiranbabu@routhkiranbabu-VirtualBox:~$ sudo apt update
Error: Malformed entry 1 in list file /etc/apt/sources.list.d/docker.list (Suite)
Error: The list of sources could not be read.
routhkiranbabu@routhkiranbabu-VirtualBox:~$
```

get error like

Good — you're very close again 👍
This error:

> **Malformed entry in `/etc/apt/sources.list.d/docker.list`**

👉 means your Docker repo line is **broken (syntax issue / line break issue)**.

✅ Fix in 2 Minutes (Clean & Safe)

🧹 Step 1: Remove the broken file

sudo rm /etc/apt/sources.list.d/docker.list

🔑 Step 2: Re-add Docker repo (CORRECT way — copy exactly)

👉 Run this as **ONE command (important)**:

echo "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg] https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sudo tee /etc/apt/sources.list.d/docker.list > /dev/null

⚠️ Common mistake you made:

- You used \ (line breaks) incorrectly
- That broke the repo format → hence “Malformed entry”

🔄 Step 3: Update again

sudo apt update

✅ Now it should work without errors

🐳 Step 4: Install Docker

sudo apt install docker-ce docker-ce-cli containerd.io -y

🔍 Why This Happened (Important)

APT expects repo file like:

deb [options] URL distro component

But your file likely became something like:

deb [arch=...] https://download.docker.com/linux/ubuntu \
questing stable

👉 That **line break (`\`) broke parsing**

🚀 Pro Tip (DevOps Mindset)

Whenever you see:

- `Malformed entry`
- `sources.list error`

👉 First instinct:

cat /etc/apt/sources.list.d/docker.list

Check if it's **one clean line**

👍 If still stuck

Send output of:

cat /etc/apt/sources.list.d/docker.list

I'll pinpoint the exact issue instantly.

```
routhkiranbabu@routhkiranbabu-VirtualBox:~$ echo "deb [arch=$(dpkg --print-architecture) signed-by=/e
tc/apt/keyrings/docker.gpg] https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sud
o tee /etc/apt/sources.list.d/docker.list > /dev/null
routhkiranbabu@routhkiranbabu-VirtualBox:~$ sudo apt update
Error: Conflicting values set for option Signed-By regarding source https://download.docker.com/linux
/ubuntu/ questing: /etc/apt/keyrings/docker.gpg != /etc/apt/keyrings/docker.asc
Error: The list of sources could not be read.
routhkiranbabu@routhkiranbabu-VirtualBox:~$
```

gets this error

Perfect — now this is the **last issue** 👍
You're getting:

> **Conflicting values set for option Signed-By**

👉 This means:

- You have **multiple Docker repo entries**
- One uses `docker.gpg`
- Another uses `docker.asc`
  ❌ APT gets confused → throws conflict error

✅ Fix (Clean Reset — Best Way)

🧹 Step 1: Remove ALL Docker repo files

sudo rm /etc/apt/sources.list.d/docker.list
sudo rm /etc/apt/sources.list.d/docker.list.save 2>/dev/null

🔍 Step 2: Check if any duplicate exists

grep -r "download.docker.com" /etc/apt/

👉 If you see anything like:

- `/etc/apt/sources.list`
- other `.list` files

❌ Remove those lines manually:

sudo nano /etc/apt/sources.list

🔑 Step 3: Keep ONLY ONE key (remove conflict)

sudo rm /etc/apt/keyrings/docker.asc 2>/dev/null

🔐 Step 4: Recreate correct key

```
sudo mkdir -p /etc/apt/keyrings

curl -fsSL https://download.docker.com/linux/ubuntu/gpg | \
sudo gpg --dearmor -o /etc/apt/keyrings/docker.gpg
```

📦 Step 5: Add clean repo (single correct entry)

```
echo "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg]
https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sudo tee
/etc/apt/sources.list.d/docker.list > /dev/null
```

🔄 Step 6: Update

```
sudo apt update
```

✅ Now **NO errors should appear**

🐳 Step 7: Install Docker

```
sudo apt install docker-ce docker-ce-cli containerd.io -y
```

🔥 Why This Happened (Interview-Level Insight)

APT security requires:

- **One repo → one signing key**

You had:

```
docker.gpg
docker.asc
```

👉 Same repo + different keys = **conflict**

🚀 Pro Debug Trick

Whenever apt breaks:

grep -r "docker" /etc/apt/

👉 Instantly shows duplicate/misconfigured entries

👍 If ANY error still comes

Paste output of:

grep -r "docker" /etc/apt/

I'll fix it in one shot.

```
routhkiranbabu@routhkiranbabu-VirtualBox:~$ grep -r "download.docker.com" /etc/apt/
/etc/apt/sources.list.d/archive_uri-https_download_docker_com_linux_ubuntu-questing.list:deb https://
download.docker.com/linux/ubuntu bionic stable
/etc/apt/sources.list.d/archive_uri-https_download_docker_com_linux_ubuntu-questing.list:# deb-src ht
tps://download.docker.com/linux/ubuntu bionic stable
/etc/apt/sources.list.d/docker.sources:URIs: https://download.docker.com/linux/ubuntu
routhkiranbabu@routhkiranbabu-VirtualBox:~$
```

then what is the next step

Great — this output clearly shows the issue 👇

👉 You still have **OLD + CONFLICTING Docker repo files**:

- ❌ `archive_uri_https_download_docker_com_linux_ubuntu-questing.list` (contains **bionic** → wrong)
- ❌ `docker.sources` (new format repo → conflicting)

✅ Final Fix (Do This Exactly)

🧹 Step 1: Remove ALL conflicting Docker repo files

sudo rm /etc/apt/sources.list.d/archive_uri_https_download_docker_com_linux_ubuntu-questing.list

```
sudo rm /etc/apt/sources.list.d/docker.sources 2>/dev/null
sudo rm /etc/apt/sources.list.d/docker.list 2>/dev/null
```

🔑 Step 2: Clean key conflicts

```
sudo rm /etc/apt/keyrings/docker.asc 2>/dev/null
sudo rm /etc/apt/keyrings/docker.gpg 2>/dev/null
```

🔐 Step 3: Add fresh Docker GPG key

```
sudo mkdir -p /etc/apt/keyrings

curl -fsSL https://download.docker.com/linux/ubuntu/gpg | \
sudo gpg --dearmor -o /etc/apt/keyrings/docker.gpg
```

📦 Step 4: Add correct repo (ONLY ONE)

```
echo "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg]
https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sudo tee
/etc/apt/sources.list.d/docker.list > /dev/null
```

🔄 Step 5: Update

```
sudo apt update
```

✅ Now:

- ❌ No bionic
- ❌ No conflict
- ❌ No GPG error

🐳 Step 6: Install Docker

```
sudo apt install docker-ce docker-ce-cli containerd.io -y
```

🔥 What You Just Fixed (Important)

You had:

- Mixed repo formats (`.list` + `.sources`)
- Wrong Ubuntu version (`bionic`)
- Multiple signing keys

👉 This is a **real DevOps troubleshooting scenario** — very valuable experience.

🚀 Final Check

docker run hello-world

👍 If anything still fails

Send:

sudo apt update

I'll debug instantly — you're 99% done now 🔥

```
routhkiranbabu@routhkiranbabu-VirtualBox:~$ sudo rm /etc/apt/sources.list.d/archive_uri_https_downloa
d_docker_com_linux_ubuntu-questing.list
rm: cannot remove '/etc/apt/sources.list.d/archive_uri_https_download_docker_com_linux_ubuntu-questin
g.list': No such file or directory
routhkiranbabu@routhkiranbabu-VirtualBox:~$
```

then what is the next step

Good — that error just means the file name is slightly different 👍 (very normal).

Let's finish this cleanly **without guessing filenames**.

✅ Step-by-Step (Bulletproof Fix)

🔍 Step 1: List actual files

Run:

ls /etc/apt/sources.list.d/

👉 You will see exact file names (copy from there)

🧹 Step 2: Remove ALL Docker-related files

Instead of guessing names, run:

sudo rm /etc/apt/sources.list.d/*docker*
sudo rm /etc/apt/sources.list.d/*archive*

👉 This removes:

- `archive_uri_...`
- `docker.sources`
- `docker.list`

🔍 Step 3: Double-check cleanup

grep -r "download.docker.com" /etc/apt/

✅ Expected: **No output**

🔑 Step 4: Recreate clean Docker setup

Create key

sudo mkdir -p /etc/apt/keyrings

curl -fsSL https://download.docker.com/linux/ubuntu/gpg | \
sudo gpg --dearmor -o /etc/apt/keyrings/docker.gpg

Add repo (correct way)

echo "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg] https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sudo tee /etc/apt/sources.list.d/docker.list > /dev/null

---

🔄 Step 5: Update

sudo apt update

✅ Now errors should be **completely gone**

🐳 Step 6: Install Docker

sudo apt install docker-ce docker-ce-cli containerd.io -y

🚀 If Still Any Error (Final Debug)

Run:

grep -r "docker" /etc/apt/

and send me output — I'll fix it instantly.
